3.4	Node Resolution	17
3.5	Tree Walking	19
4	Export to DOT	21
5	Getting started	25
	Python Module Index	29

Simple, lightweight and extensible [Tree](#) data structure.

CHAPTER 1

Installation

To install the *anytree* module run:

```
pip install anytree
```

If you do not have write-permissions to the python installation, try:

```
pip install anytree --user
```

Overview

anytree is splitted into the following parts:

Node Classes

- *Node*: a simple tree node
- *NodeMixin*: extends any python class to a tree node.

Node Resolution

- *Resolver*: retrieve node via absolute or relative path.
- *Walker*: walk from one node to an other.

Tree Iteration Strategies

- *PreOrderIter*: iterate over tree using pre-order strategy
- *PostOrderIter*: iterate over tree using post-order strategy

Tree Rendering

- ***RenderTree*** using the following styles:
 - *AsciiStyle*
 - *ContStyle*
 - *ContRoundStyle*
 - *DoubleStyle*

Basics

The only tree relevant information is the *parent* attribute. If *None* the node is root node. If set to another node, the node becomes the child of it.

```
>>> udo = Node("Udo")
>>> marc = Node("Marc")
>>> lian = Node("Lian", parent=marc)
>>> print(RenderTree(udo))
Node('/Udo')
>>> print(RenderTree(marc))
Node('/Marc')
- Node('/Marc/Lian')
```

Every node has an *children* attribute with a tuple of all children:

Every node has an *children* attribute with a tuple of all children:

```
>>> udo.children
()
>>> marc.children
(Node('/Marc/Lian'),)
>>> lian.children
()
```

Attach

```
>>> marc.parent = udo
>>> print(RenderTree(udo))
Node('/Udo')
- Node('/Udo/Marc')
  - Node('/Udo/Marc/Lian')
```

Detach

To make a node to a root node, just set this attribute to *None*.

```
>>> marc.is_root
False
>>> marc.parent = None
>>> marc.is_root
True
```

Detach/Attach Protocol

A node class implementation might implement the notification slots `_pre_detach(parent)`, `_post_detach(parent)`, `_pre_attach(parent)`, `_post_attach(parent)`.

```
>>> class NotifiedNode(Node):
...     def _pre_detach(self, parent):
...         print("_pre_detach", parent)
...     def _post_detach(self, parent):
...         print("_post_detach", parent)
...     def _pre_attach(self, parent):
...         print("_pre_attach", parent)
```

```
...     def _post_attach(self, parent):  
...         print("_post_attach", parent)
```

Notification on attach:

```
>>> a = NotifiedNode("a")  
>>> b = NotifiedNode("b")  
>>> c = NotifiedNode("c")  
>>> c.parent = a  
_pre_attach NotifiedNode('/a')  
_post_attach NotifiedNode('/a')
```

Notification on change:

```
>>> c.parent = b  
_pre_detach NotifiedNode('/a')  
_post_detach NotifiedNode('/a')  
_pre_attach NotifiedNode('/b')  
_post_attach NotifiedNode('/b')
```

If the parent equals the old value, the notification is not triggered:

```
>>> c.parent = b
```

Notification on detach:

```
>>> c.parent = None  
_pre_detach NotifiedNode('/b')  
_post_detach NotifiedNode('/b')
```

Node Classes

class `anytree.node.NodeMixin`

Bases: `object`

The *NodeMixin* class extends any Python class to a tree node.

The only tree relevant information is the *parent* attribute. If *None* the *NodeMixin* is root node. If set to another node, the *NodeMixin* becomes the child of it.

```
>>> from anytree import Node, RenderTree
>>> class MyBaseClass(object):
...     foo = 4
>>> class MyClass(MyBaseClass, NodeMixin): # Add Node feature
...     def __init__(self, name, length, width, parent=None):
...         super(MyClass, self).__init__()
...         self.name = name
...         self.length = length
...         self.width = width
...         self.parent = parent
```

```
>>> my0 = MyClass('my0', 0, 0)
>>> my1 = MyClass('my1', 1, 0, parent=my0)
>>> my2 = MyClass('my2', 0, 2, parent=my0)
```

```
>>> for pre, _, node in RenderTree(my0):
...     treestr = u"%s%s" % (pre, node.name)
...     print(treestr.ljust(8), node.length, node.width)
my0      0 0
- my1    1 0
- my2    0 2
```

parent

Parent Node.

On set, the node is detached from any previous parent node and attached to the new node.

```
>>> from anytree import Node, RenderTree
>>> udo = Node("Udo")
>>> marc = Node("Marc")
>>> lian = Node("Lian", parent=marc)
>>> print(RenderTree(udo))
Node('/Udo')
>>> print(RenderTree(marc))
Node('/Marc')
- Node('/Marc/Lian')
```

Attach

```
>>> marc.parent = udo
>>> print(RenderTree(udo))
Node('/Udo')
- Node('/Udo/Marc')
  - Node('/Udo/Marc/Lian')
```

Detach

To make a node to a root node, just set this attribute to *None*.

```
>>> marc.is_root
False
>>> marc.parent = None
>>> marc.is_root
True
```

children

All child nodes.

```
>>> dan = Node("Dan")
>>> jet = Node("Jet", parent=dan)
>>> jan = Node("Jan", parent=dan)
>>> joe = Node("Joe", parent=dan)
>>> dan.children
(Node('/Dan/Jet'), Node('/Dan/Jan'), Node('/Dan/Joe'))
```

path

Path of this *Node*.

```
>>> udo = Node("Udo")
>>> marc = Node("Marc", parent=udo)
>>> lian = Node("Lian", parent=marc)
>>> udo.path
(Node('/Udo'),)
>>> marc.path
(Node('/Udo'), Node('/Udo/Marc'))
>>> lian.path
(Node('/Udo'), Node('/Udo/Marc'), Node('/Udo/Marc/Lian'))
```

ancestors

All parent nodes and their parent nodes.

```
>>> udo = Node("Udo")
>>> marc = Node("Marc", parent=udo)
>>> lian = Node("Lian", parent=marc)
```

```
>>> udo.ancestors
()
>>> marc.ancestors
(Node('/',Udo'),)
>>> lian.ancestors
(Node('/',Udo'), Node('/',Udo/Marc'))
```

descendants

All child nodes and all their child nodes.

```
>>> udo = Node("Udo")
>>> marc = Node("Marc", parent=udo)
>>> lian = Node("Lian", parent=marc)
>>> loui = Node("Loui", parent=marc)
>>> soe = Node("Soe", parent=lian)
>>> udo.descendants
(Node('/',Udo/Marc'), Node('/',Udo/Marc/Lian'), Node('/',Udo/Marc/Lian/Soe'), Node(
↳ '/',Udo/Marc/Loui'))
>>> marc.descendants
(Node('/',Udo/Marc/Lian'), Node('/',Udo/Marc/Lian/Soe'), Node('/',Udo/Marc/Loui'))
>>> lian.descendants
(Node('/',Udo/Marc/Lian/Soe'),)
```

root

Tree Root Node.

```
>>> udo = Node("Udo")
>>> marc = Node("Marc", parent=udo)
>>> lian = Node("Lian", parent=marc)
>>> udo.root
Node('/',Udo')
>>> marc.root
Node('/',Udo')
>>> lian.root
Node('/',Udo')
```

siblings

Tuple of nodes with the same parent.

```
>>> udo = Node("Udo")
>>> marc = Node("Marc", parent=udo)
>>> lian = Node("Lian", parent=marc)
>>> loui = Node("Loui", parent=marc)
>>> lazy = Node("Lazy", parent=marc)
>>> udo.siblings
()
>>> marc.siblings
()
>>> lian.siblings
(Node('/',Udo/Marc/Loui'), Node('/',Udo/Marc/Lazy'))
>>> loui.siblings
(Node('/',Udo/Marc/Lian'), Node('/',Udo/Marc/Lazy'))
```

is_leaf

Node has no children (External Node).

```
>>> udo = Node("Udo")
>>> marc = Node("Marc", parent=udo)
>>> lian = Node("Lian", parent=marc)
>>> udo.is_leaf
False
>>> marc.is_leaf
False
>>> lian.is_leaf
True
```

is_root

Node is tree root.

```
>>> udo = Node("Udo")
>>> marc = Node("Marc", parent=udo)
>>> lian = Node("Lian", parent=marc)
>>> udo.is_root
True
>>> marc.is_root
False
>>> lian.is_root
False
```

height

Number of edges on the longest path to a leaf *Node*.

```
>>> udo = Node("Udo")
>>> marc = Node("Marc", parent=udo)
>>> lian = Node("Lian", parent=marc)
>>> udo.height
2
>>> marc.height
1
>>> lian.height
0
```

depth

Number of edges to the root *Node*.

```
>>> udo = Node("Udo")
>>> marc = Node("Marc", parent=udo)
>>> lian = Node("Lian", parent=marc)
>>> udo.depth
0
>>> marc.depth
1
>>> lian.depth
2
```

class `anytree.node.Node` (*name*, *parent*=None, ****kwargs**)

Bases: `anytree.node.NodeMixin`, object

A simple tree node with a *name* and any *kwargs*.

```
>>> from anytree import Node, RenderTree
>>> root = Node("root")
>>> s0 = Node("sub0", parent=root)
>>> s0b = Node("sub0B", parent=s0, foo=4, bar=109)
```

```
>>> s0a = Node("sub0A", parent=s0)
>>> s1 = Node("sub1", parent=root)
>>> s1a = Node("sub1A", parent=s1)
>>> s1b = Node("sub1B", parent=s1, bar=8)
>>> s1c = Node("sub1C", parent=s1)
>>> s1ca = Node("sub1Ca", parent=s1c)
```

```
>>> print(RenderTree(root))
Node('/root')
- Node('/root/sub0')
|   - Node('/root/sub0/sub0B', bar=109, foo=4)
|   - Node('/root/sub0/sub0A')
- Node('/root/sub1')
  - Node('/root/sub1/sub1A')
  - Node('/root/sub1/sub1B', bar=8)
  - Node('/root/sub1/sub1C')
    - Node('/root/sub1/sub1C/sub1Ca')
```

name
Name.

exception `anytree.node.LoopError`
Bases: `exceptions.RuntimeError`
Tree contains infinite loop.

Tree Iteration Strategies

class `anytree.iterators.PreOrderIter(node)`
Bases: `object`

Iterate over tree applying pre-order strategy starting at *node*.

Start at root and go-down until reaching a leaf node. Step upwards then, and search for the next leafs.

```
>>> from anytree import Node, RenderTree, AsciiStyle
>>> f = Node("f")
>>> b = Node("b", parent=f)
>>> a = Node("a", parent=b)
>>> d = Node("d", parent=b)
>>> c = Node("c", parent=d)
>>> e = Node("e", parent=d)
>>> g = Node("g", parent=f)
>>> i = Node("i", parent=g)
>>> h = Node("h", parent=i)
>>> print(RenderTree(f, style=AsciiStyle()))
Node('/f')
|-- Node('/f/b')
|   |-- Node('/f/b/a')
|   +-- Node('/f/b/d')
|       |-- Node('/f/b/d/c')
|       +-- Node('/f/b/d/e')
+-- Node('/f/g')
    +-- Node('/f/g/i')
        +-- Node('/f/g/i/h')
```

```
>>> [node.name for node in PreOrderIter(f)]
['f', 'b', 'a', 'd', 'c', 'e', 'g', 'i', 'h']
```

class `anytree.iterators.PostOrderIter`(*node*)

Bases: `object`

Iterate over tree applying post-order strategy starting at *node*.

```
>>> from anytree import Node, RenderTree, AsciiStyle
>>> f = Node("f")
>>> b = Node("b", parent=f)
>>> a = Node("a", parent=b)
>>> d = Node("d", parent=b)
>>> c = Node("c", parent=d)
>>> e = Node("e", parent=d)
>>> g = Node("g", parent=f)
>>> i = Node("i", parent=g)
>>> h = Node("h", parent=i)
>>> print(RenderTree(f, style=AsciiStyle()))
Node('/f')
|-- Node('/f/b')
|   |-- Node('/f/b/a')
|   +-- Node('/f/b/d')
|       |-- Node('/f/b/d/c')
|       +-- Node('/f/b/d/e')
+-- Node('/f/g')
    +-- Node('/f/g/i')
        +-- Node('/f/g/i/h')
```

```
>>> [node.name for node in PostOrderIter(f)]
['a', 'c', 'e', 'd', 'b', 'h', 'i', 'g', 'f']
```

Tree Rendering

class `anytree.render.AbstractStyle`(*vertical, cont, end*)

Bases: `object`

Tree Render Style.

Args:

vertical: Sign for vertical line.

cont: Chars for a continued branch.

end: Chars for the last branch.

empty

Empty string as placeholder.

class `anytree.render.AsciiStyle`

Bases: `anytree.render.AbstractStyle`

Ascii style.

```
>>> from anytree import Node, RenderTree
>>> root = Node("root")
>>> s0 = Node("sub0", parent=root)
```

```
>>> s0b = Node("sub0B", parent=s0)
>>> s0a = Node("sub0A", parent=s0)
>>> s1 = Node("sub1", parent=root)
```

```
>>> print(RenderTree(root, style=AsciiStyle()))
Node('/root')
|-- Node('/root/sub0')
|   |-- Node('/root/sub0/sub0B')
|   +-- Node('/root/sub0/sub0A')
+-- Node('/root/sub1')
```

class anytree.render.ContStyle

Bases: *anytree.render.AbstractStyle*

Continued style, without gaps.

```
>>> from anytree import Node, RenderTree
>>> root = Node("root")
>>> s0 = Node("sub0", parent=root)
>>> s0b = Node("sub0B", parent=s0)
>>> s0a = Node("sub0A", parent=s0)
>>> s1 = Node("sub1", parent=root)
```

```
>>> print(RenderTree(root, style=ContStyle()))
Node('/root')
- Node('/root/sub0')
|   - Node('/root/sub0/sub0B')
|   - Node('/root/sub0/sub0A')
- Node('/root/sub1')
```

class anytree.render.ContRoundStyle

Bases: *anytree.render.AbstractStyle*

Continued style, without gaps, round edges.

```
>>> from anytree import Node, RenderTree
>>> root = Node("root")
>>> s0 = Node("sub0", parent=root)
>>> s0b = Node("sub0B", parent=s0)
>>> s0a = Node("sub0A", parent=s0)
>>> s1 = Node("sub1", parent=root)
```

```
>>> print(RenderTree(root, style=ContRoundStyle()))
Node('/root')
- Node('/root/sub0')
|   - Node('/root/sub0/sub0B')
|   - Node('/root/sub0/sub0A')
- Node('/root/sub1')
```

class anytree.render.DoubleStyle

Bases: *anytree.render.AbstractStyle*

Double line style, without gaps.

```
>>> from anytree import Node, RenderTree
>>> root = Node("root")
>>> s0 = Node("sub0", parent=root)
```

```
>>> s0b = Node("sub0B", parent=s0)
>>> s0a = Node("sub0A", parent=s0)
>>> s1 = Node("sub1", parent=root)
```

```
>>> print(RenderTree(root, style=DoubleStyle))
Node('/root')
  Node('/root/sub0')
    Node('/root/sub0/sub0B')
    Node('/root/sub0/sub0A')
  Node('/root/sub1')
```

class `anytree.render.RenderTree` (*node*, *style=ContStyle()*, *childiter=<type 'list'>*)

Bases: `object`

Render tree starting at *node*.

Keyword Args: *style* (`AbstractStyle`): Render Style.

childiter: Child iterator.

RenderTree is an iterator, returning a tuple with 3 items:

pre tree prefix.

fill filling for multiline entries.

node *NodeMixin* object.

It is up to the user to assemble these parts to a whole.

```
>>> from anytree import Node, RenderTree
>>> root = Node("root", lines=["c0fe", "c0de"])
>>> s0 = Node("sub0", parent=root, lines=["ha", "ba"])
>>> s0b = Node("sub0B", parent=s0, lines=["1", "2", "3"])
>>> s0a = Node("sub0A", parent=s0, lines=["a", "b"])
>>> s1 = Node("sub1", parent=root, lines=["Z"])
```

Simple one line:

```
>>> for pre, _, node in RenderTree(root):
...     print("%s%s" % (pre, node.name))
root
- sub0
|   - sub0B
|   - sub0A
- sub1
```

Multiline:

```
>>> for pre, fill, node in RenderTree(root):
...     print("%s%s" % (pre, node.lines[0]))
...     for line in node.lines[1:]:
...         print("%s%s" % (fill, line))
c0fe
c0de
- ha
|   ba
|   - 1
|   | 2
|   | 3
```

```
|   - a
|       b
- z
```

The *childiter* is responsible for iterating over child nodes at the same level. An reversed order can be achieved by using *reversed*.

```
>>> for pre, _, node in RenderTree(root, childiter=reversed):
...     print("%s%s" % (pre, node.name))
root
- sub1
- sub0
  - sub0A
  - sub0B
```

Or writing your own sort function:

```
>>> def mysort(items):
...     return sorted(items, key=lambda item: item.name)
>>> for pre, _, node in RenderTree(root, childiter=mysort):
...     print("%s%s" % (pre, node.name))
root
- sub0
  |   - sub0A
  |   - sub0B
- sub1
```

Node Resolution

class `anytree.resolver.Resolver` (*pathattr*='name')

Bases: `object`

Resolve *NodeMixin* paths using attribute *pathattr*.

get (*node*, *path*)

Return instance at *path*.

An example module tree:

```
>>> from anytree import Node
>>> top = Node("top", parent=None)
>>> sub0 = Node("sub0", parent=top)
>>> sub0sub0 = Node("sub0sub0", parent=sub0)
>>> sub0sub1 = Node("sub0sub1", parent=sub0)
>>> sub1 = Node("sub1", parent=top)
```

A resolver using the *name* attribute:

```
>>> r = Resolver('name')
```

Relative paths:

```
>>> r.get(top, "sub0/sub0sub0")
Node('/top/sub0/sub0sub0')
>>> r.get(sub1, "..")
Node('/top')
```

```

>>> r.get(sub1, "../sub0/sub0sub1")
Node('/top/sub0/sub0sub1')
>>> r.get(sub1, ".")
Node('/top/sub1')
>>> r.get(sub1, "")
Node('/top/sub1')
>>> r.get(top, "sub2")
Traceback (most recent call last):
...
anytree.resolver.ChildResolverError: Node('/top') has no child sub2. Children_
↳are: 'sub0', 'sub1'.

```

Absolute paths:

```

>>> r.get(sub0sub0, "/top")
Node('/top')
>>> r.get(sub0sub0, "/top/sub0")
Node('/top/sub0')
>>> r.get(sub0sub0, "/")
Traceback (most recent call last):
...
anytree.resolver.ResolverError: root node missing. root is '/top'.
>>> r.get(sub0sub0, "/bar")
Traceback (most recent call last):
...
anytree.resolver.ResolverError: unknown root node '/bar'. root is '/top'.

```

glob (*node*, *path*)

Return instances at *path* supporting wildcards.

Behaves identical to *get*, but accepts wildcards and returns a list of found nodes.

- * matches any characters, except '/'.
- ? matches a single character, except '/'.

An example module tree:

```

>>> from anytree import Node
>>> top = Node("top", parent=None)
>>> sub0 = Node("sub0", parent=top)
>>> sub0sub0 = Node("sub0", parent=sub0)
>>> sub0sub1 = Node("sub1", parent=sub0)
>>> sub1 = Node("sub1", parent=top)
>>> sub1sub0 = Node("sub0", parent=sub1)

```

A resolver using the *name* attribute:

```

>>> r = Resolver('name')

```

Relative paths:

```

>>> r.glob(top, "sub0/sub?")
[Node('/top/sub0/sub0'), Node('/top/sub0/sub1')]
>>> r.glob(sub1, ".././*")
[Node('/top/sub0'), Node('/top/sub1')]
>>> r.glob(top, "*/*")
[Node('/top/sub0/sub0'), Node('/top/sub0/sub1'), Node('/top/sub1/sub0')]
>>> r.glob(top, "*/sub0")

```

```
[Node('/top/sub0/sub0'), Node('/top/sub1/sub0')]
>>> r.glob(top, "sub1/sub1")
Traceback (most recent call last):
...
anytree.resolver.ChildResolverError: Node('/top/sub1') has no child sub1.
↳Children are: 'sub0'.
```

Non-matching wildcards are no error:

```
>>> r.glob(top, "bar*")
[]
>>> r.glob(top, "sub2")
Traceback (most recent call last):
...
anytree.resolver.ChildResolverError: Node('/top') has no child sub2. Children
↳are: 'sub0', 'sub1'.
```

Absolute paths:

```
>>> r.glob(sub0sub0, "/top/*")
[Node('/top/sub0'), Node('/top/sub1')]
>>> r.glob(sub0sub0, "/")
Traceback (most recent call last):
...
anytree.resolver.ResolverError: root node missing. root is '/top'.
>>> r.glob(sub0sub0, "/bar")
Traceback (most recent call last):
...
anytree.resolver.ResolverError: unknown root node '/bar'. root is '/top'.
```

exception anytree.resolver.**ResolverError** (*node, child, msg*)

Bases: exceptions.RuntimeError

Resolve Error at *node* handling *child*.

exception anytree.resolver.**ChildResolverError** (*node, child, children*)

Bases: *anytree.resolver.ResolverError*

Child Resolve Error at *node* handling *child* with known *children*.

Tree Walking

class anytree.walker.**Walker**

Bases: object

Walk from one node to another.

walk (*start, end*)

Walk from *start* node to *end* node.

Returns: (upwards, downwards): *upwards* is a list of edges to parent nodes to go upward to. *downwards* is a list of edges to child nodes to go downward to.

Raises: WalkError: on no common root node.

```
>>> from anytree import Node, RenderTree, AsciiStyle
>>> f = Node("f")
>>> b = Node("b", parent=f)
```

```
>>> a = Node("a", parent=b)
>>> d = Node("d", parent=b)
>>> c = Node("c", parent=d)
>>> e = Node("e", parent=d)
>>> g = Node("g", parent=f)
>>> i = Node("i", parent=g)
>>> h = Node("h", parent=i)
>>> print(RenderTree(f, style=AsciiStyle()))
Node('/f')
|-- Node('/f/b')
|   |-- Node('/f/b/a')
|   +-- Node('/f/b/d')
|       |-- Node('/f/b/d/c')
|       +-- Node('/f/b/d/e')
+-- Node('/f/g')
    +-- Node('/f/g/i')
        +-- Node('/f/g/i/h')
```

Create a walker:

```
>>> w = Walker()
```

This class is made for walking:

```
>>> w.walk(f, f)
([], [])
>>> w.walk(f, b)
([], [Node('/f/b')])
>>> w.walk(b, f)
([Node('/f')], [])
>>> w.walk(a, f)
([Node('/f/b'), Node('/f')], [])
>>> w.walk(b, f)
([Node('/f')], [])
>>> w.walk(h, e)
([Node('/f/g/i'), Node('/f/g'), Node('/f')], [Node('/f/b'), Node('/f/b/d'),
↪Node('/f/b/d/e')])
```

For a proper walking the nodes need to be part of the same tree:

```
>>> w.walk(Node("a"), Node("b"))
Traceback (most recent call last):
...
anytree.walker.WalkError: Node('/a') and Node('/b') are not part of the same_
↪tree.
```

exception anytree.walker.**WalkError**
Bases: exceptions.RuntimeError
Walk Error.

CHAPTER 4

Export to DOT

Any `anytree` graph can be converted to a `graphviz` graph.

This tree:

```
>>> from anytree import Node
>>> root = Node("root")
>>> s0 = Node("sub0", parent=root)
>>> s0b = Node("sub0B", parent=s0)
>>> s0a = Node("sub0A", parent=s0)
>>> s1 = Node("sub1", parent=root)
>>> s1a = Node("sub1A", parent=s1)
>>> s1b = Node("sub1B", parent=s1)
>>> s1c = Node("sub1C", parent=s1)
>>> s1ca = Node("sub1Ca", parent=s1c)
```

Can be rendered to a tree by `RenderTreeGraph`:

```
>>> from anytree.dotexport import RenderTreeGraph
>>> RenderTreeGraph(root).to_picture("tree.png")
```

class anytree.dotexport.**RenderTreeGraph**(*node*, graph='digraph', name='tree', options=None, indent=4, nodenamefunc=None, nodeattrfunc=None, edgeattrfunc=None)

Bases: anytree.dotexport._Render

Dot Language Exporter.

Args: node (Node): start node.

Keyword Args: graph: DOT graph type.

name: DOT graph name.

options: list of options added to the graph.

indent (int): number of spaces for indent.

nodenamefunc: Function to extract node name from *node* object. The function shall accept one *node* object as argument and return the name of it.

nodeattrfunc: Function to decorate a node with attributes. The function shall accept one *node* object as argument and return the attributes.

edgeattrfunc: Function to decorate a edge with attributes. The function shall accept two *node* objects as argument. The first the node and the second the child and return the attributes.

```

>>> from anytree import Node
>>> root = Node("root")
>>> s0 = Node("sub0", parent=root, edge=2)
>>> s0b = Node("sub0B", parent=s0, foo=4, edge=109)
>>> s0a = Node("sub0A", parent=s0, edge="")
>>> s1 = Node("sub1", parent=root, edge="")
>>> s1a = Node("sub1A", parent=s1, edge=7)
  
```

```
>>> slb = Node("sub1B", parent=s1, edge=8)
>>> slc = Node("sub1C", parent=s1, edge=22)
>>> slca = Node("sub1Ca", parent=slc, edge=42)
```

```
>>> for line in RenderTreeGraph(root):
...     print(line)
digraph tree {
    "root";
    "sub0";
    "sub0B";
    "sub0A";
    "sub1";
    "sub1A";
    "sub1B";
    "sub1C";
    "sub1Ca";
    "root" -> "sub0";
    "root" -> "sub1";
    "sub0" -> "sub0B";
    "sub0" -> "sub0A";
    "sub1" -> "sub1A";
    "sub1" -> "sub1B";
    "sub1" -> "sub1C";
    "sub1C" -> "sub1Ca";
}
```

```
>>> def nodenamefunc(node):
...     return '%s:%s' % (node.name, node.depth)
>>> def edgeattrfunc(node, child):
...     return 'label="%s:%s"' % (node.name, child.name)
>>> for line in RenderTreeGraph(root, options=["rankdir=LR;"],
...     nodenamefunc=nodenamefunc,
...     nodeattrfunc=lambda node: "shape=box",
...     edgeattrfunc=edgeattrfunc):
...     print(line)
digraph tree {
    rankdir=LR;
    "root:0" [shape=box];
    "sub0:1" [shape=box];
    "sub0B:2" [shape=box];
    "sub0A:2" [shape=box];
    "sub1:1" [shape=box];
    "sub1A:2" [shape=box];
    "sub1B:2" [shape=box];
    "sub1C:2" [shape=box];
    "sub1Ca:3" [shape=box];
    "root:0" -> "sub0:1" [label="root:sub0"];
    "root:0" -> "sub1:1" [label="root:sub1"];
    "sub0:1" -> "sub0B:2" [label="sub0:sub0B"];
    "sub0:1" -> "sub0A:2" [label="sub0:sub0A"];
    "sub1:1" -> "sub1A:2" [label="sub1:sub1A"];
    "sub1:1" -> "sub1B:2" [label="sub1:sub1B"];
    "sub1:1" -> "sub1C:2" [label="sub1:sub1C"];
    "sub1C:2" -> "sub1Ca:3" [label="sub1C:sub1Ca"];
}
```

to_dotfile (filename)

Write graph to *filename*.

```
>>> from anytree import Node
>>> root = Node("root")
>>> s0 = Node("sub0", parent=root)
>>> s0b = Node("sub0B", parent=s0)
>>> s0a = Node("sub0A", parent=s0)
>>> s1 = Node("sub1", parent=root)
>>> s1a = Node("sub1A", parent=s1)
>>> s1b = Node("sub1B", parent=s1)
>>> s1c = Node("sub1C", parent=s1)
>>> s1ca = Node("sub1Ca", parent=s1c)
```

```
>>> RenderTreeGraph(root).to_dotfile("tree.dot")
```

The generated file should be handed over to the *dot* tool from the <http://www.graphviz.org/> package:

```
$ dot tree.dot -T png -o tree.png
```

to_picture (*filename*)

Write graph to a temporary file and invoke *dot*.

The output file type is automatically detected from the file suffix.

‘graphviz’ needs to be installed, before usage of this method.

CHAPTER 5

Getting started

Usage is simple.

Construction

```
>>> from anytree import Node, RenderTree
>>> udo = Node("Udo")
>>> marc = Node("Marc", parent=udo)
>>> lian = Node("Lian", parent=marc)
>>> dan = Node("Dan", parent=udo)
>>> jet = Node("Jet", parent=dan)
>>> jan = Node("Jan", parent=dan)
>>> joe = Node("Joe", parent=dan)
```

Node

```
>>> print(udo)
Node('/Udo')
>>> print(joe)
Node('/Udo/Dan/Joe')
```

Tree

```
>>> for pre, fill, node in RenderTree(udo):
...     print("%s%s" % (pre, node.name))
Udo
- Marc
|   - Lian
- Dan
    - Jet
    - Jan
    - Joe
```

```
>>> from anytree.dotexport import RenderTreeGraph
>>> # graphviz needs to be installed for the next line!
>>> RenderTreeGraph(root).to_picture("udo.png")
```

Manipulation

A second tree:

```
>>> mary = Node("Mary")
>>> urs = Node("Urs", parent=mary)
>>> chris = Node("Chris", parent=mary)
>>> marta = Node("Marta", parent=mary)
>>> print(RenderTree(mary))
Node('/Mary')
- Node('/Mary/Urs')
- Node('/Mary/Chris')
- Node('/Mary/Marta')
```

Append:

```
>>> udo.parent = mary
>>> print(RenderTree(mary))
Node('/Mary')
- Node('/Mary/Urs')
- Node('/Mary/Chris')
- Node('/Mary/Marta')
- Node('/Mary/Udo')
  - Node('/Mary/Udo/Marc')
    | - Node('/Mary/Udo/Marc/Lian')
  - Node('/Mary/Udo/Dan')
    - Node('/Mary/Udo/Dan/Jet')
    - Node('/Mary/Udo/Dan/Jan')
    - Node('/Mary/Udo/Dan/Joe')
```

Subtree rendering:

```
>>> print(RenderTree(marc))
Node('/Mary/Udo/Marc')
- Node('/Mary/Udo/Marc/Lian')
```

Cut:

```
>>> dan.parent = None
>>> print(RenderTree(dan))
Node('/Dan')
- Node('/Dan/Jet')
- Node('/Dan/Jan')
- Node('/Dan/Joe')
```
